What's a computer?

Dictionary

Search for a word 

 **com·put·er**
/kəm'pyoȯdər/
noun
an electronic device for storing and processing data, typically in binary form, according to instructions given to it in a variable program.

- a person who makes calculations, especially with a calculating machine.

 More images

A computer is a machine that can be instructed to carry out sequences of arithmetic or logical operations automatically via computer programming. Modern computers have the ability to follow generalized sets of operations, called programs. These programs enable computers to perform an extremely wide range of tasks. [Wikipedia](#)

What's a computer?

- By the middle of the 20th century, this term referred to a human computer, a person who carried out calculations or computations.

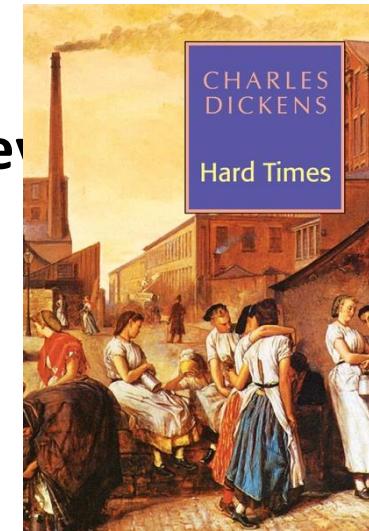

Computers have replaced
“computers” (humans)!

So, will AI replace humans?

- Today?
 - Will probably replace those who truly believe today's AI will replace humans :-P
- Eventually?
 - Maybe yes, maybe not...

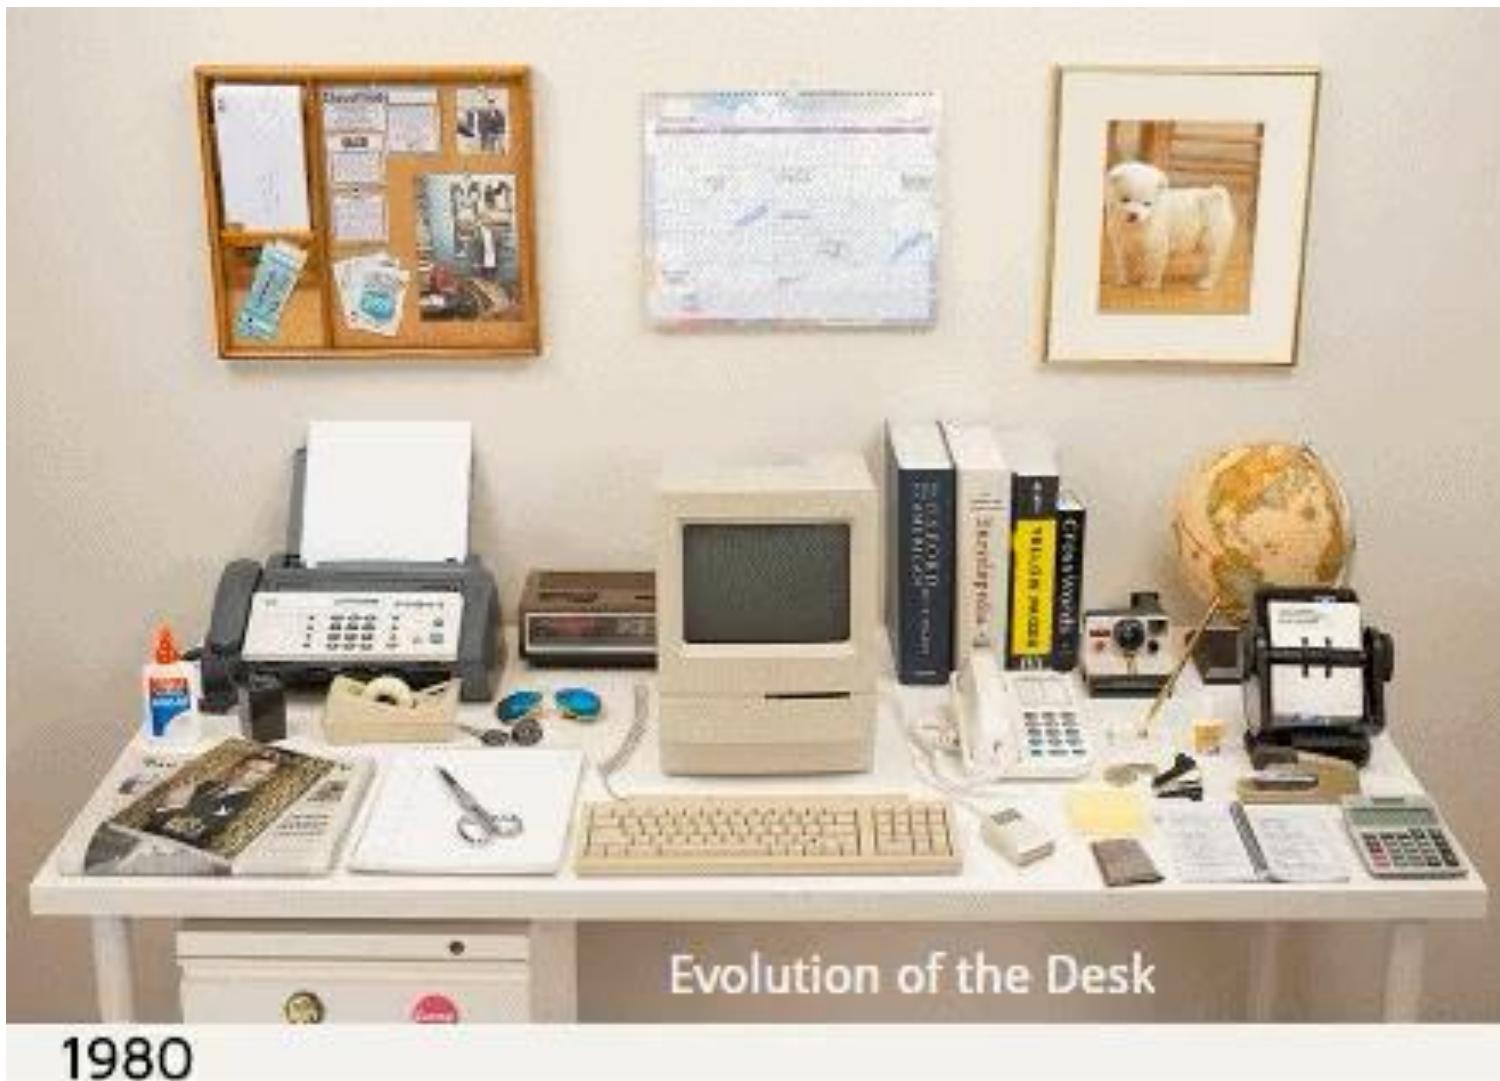

"People mutht be amuthed. They can't be alwayth a learning, nor yet they can't be alwayth a working, they an't made for it."

AI should be nothing but *facts, work, and logic.*

Industry 4.0: Industrial Internet of Things

- The Fourth Industry Revolution, Another 100 Years?

What is AI?

Alan Turing in 1950:
“Can Machines Think?”

A. M. Turing (1950) Computing Machinery and Intelligence. *Mind* 49: 433-460.

COMPUTING MACHINERY AND INTELLIGENCE

By A. M. Turing

1. The Imitation Game

I propose to consider the question, "Can machines think?" This should begin with definitions of the meaning of the terms "machine" and "think." The definitions might be framed so as to reflect so far as possible the normal use of the words, but this attitude is dangerous. If the meaning of the words "machine" and "think" are to be found by examining how they are commonly used it is difficult to escape the conclusion that the meaning and the answer to the question, "Can machines think?" is to be sought in a statistical survey such as a Gallup poll. But this is absurd. Instead of attempting such a definition I shall replace the question by another, which is closely related to it and is expressed in relatively unambiguous words.

What is AI?

Alan Turing in 1950:
“Can Machines Think?”

**“Completely Automated
Public Turing test to tell
Computers and Humans Apart”**

ARTIFICIAL INTELLIGENCE

A Proposal for the Dartmouth Summer Research Project on Artificial Intelligence

August 31, 1955

Computational Intelligence

Machines can do calculating as human beings and process huge amounts of data.

5 Dartmouth Workshop participants
on AI 50th anniversary, 2006

Perceptual Intelligence

Machines can read and understand, typically like speech and vision recognition.

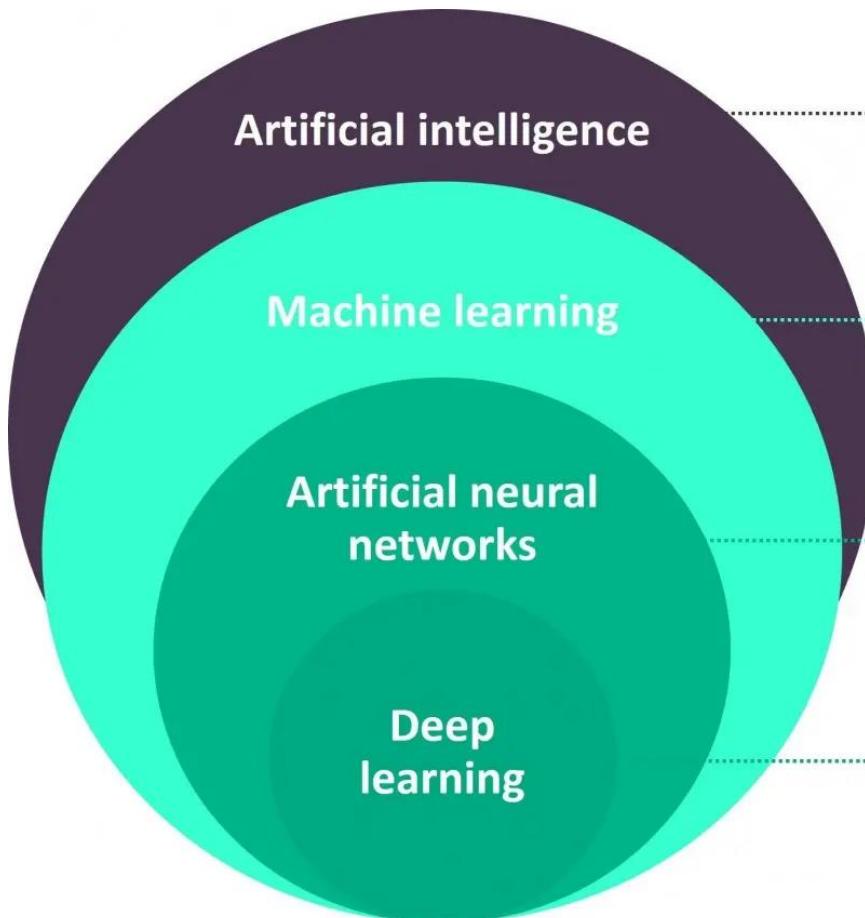

Cognitive intelligence

Machines can turn information into knowledge while trying to think of, assist or even substitute human beings for most of the work.

What is AI?

Artificial intelligence (AI)

Any techniques that enable machines to solve a task in a way like humans do

Machine learning (ML)

Algorithms that allow computers to learn from examples without being explicitly programmed

Artificial neural networks (ANN)

Brain-inspired machine learning models

Deep learning (DL)

A subset of ML which uses deep artificial neural networks as models and automatically builds a hierarchy of data representations

Three Laws

01

Moore's Law

02

Gilder's Law

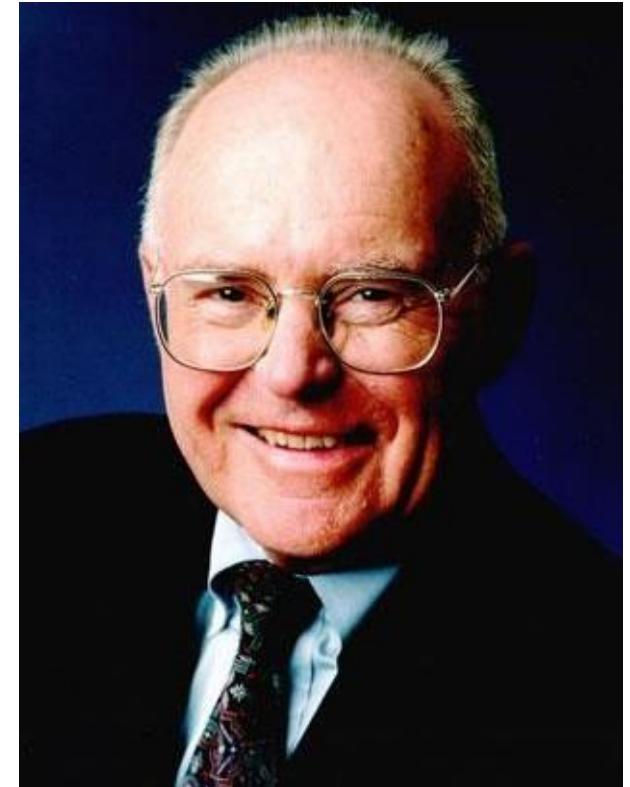

03

Metcalfe's law

1

Moore's Law

- The number of transistors that can be packed into a given unit of space will double every two years.
- Processor speeds, or overall processing power for computers will double about every 18 month's.

Gordon E. Moore
Co-Founder of Intel

2 Gilder's Law

- The bandwidth of communications systems doubles every 6 months.

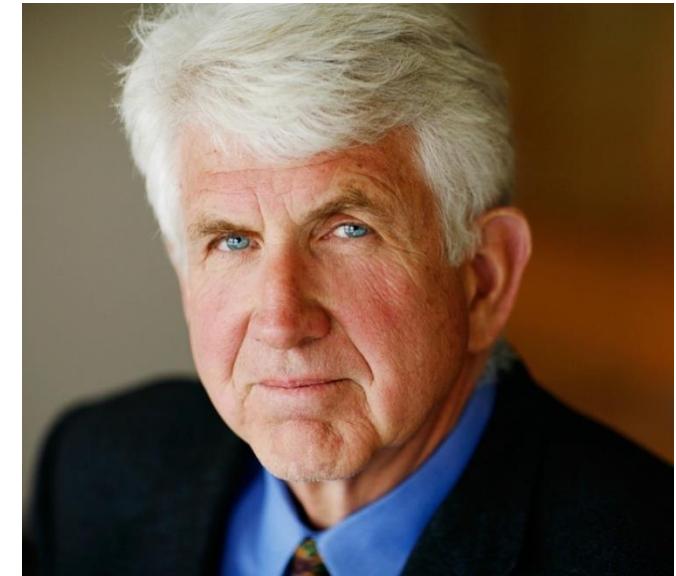

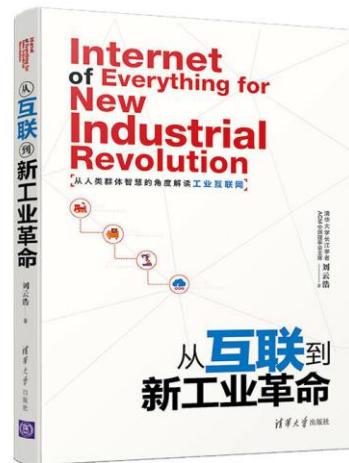

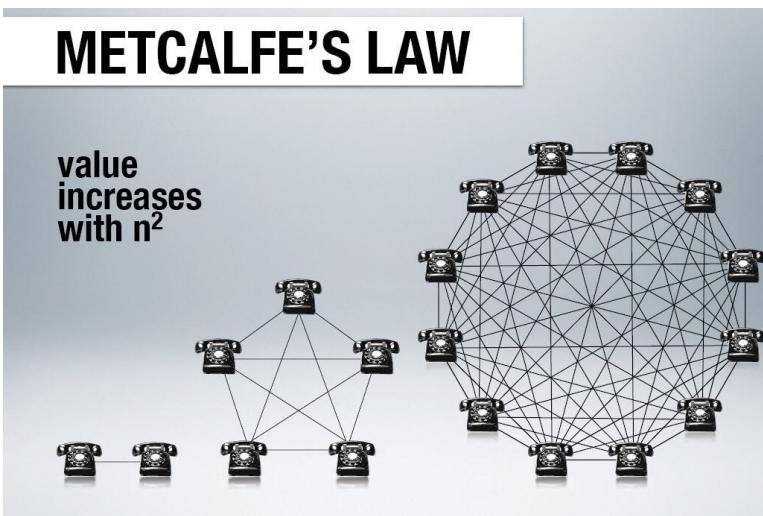

George Gilder

Investor, Writer, and
Economist

3

Metcalf's Law

- The value of a telecommunications network is proportional to the square of the number of connected users (compatible communicating devices) of the system.

Robert Melancton Metcalfe
Turing Award (2022)
Co-Inventor of Ethernet
Co-Founder of 3Com

The Fourth Industry Revolution Is Coming.

**THE FOURTH INDUSTRIAL REVOLUTION:
WHAT IT IS AND HOW TO PREPARE**

: Take an IoT course at HKU.

What Is IoT?

Dates back to the 1980s...

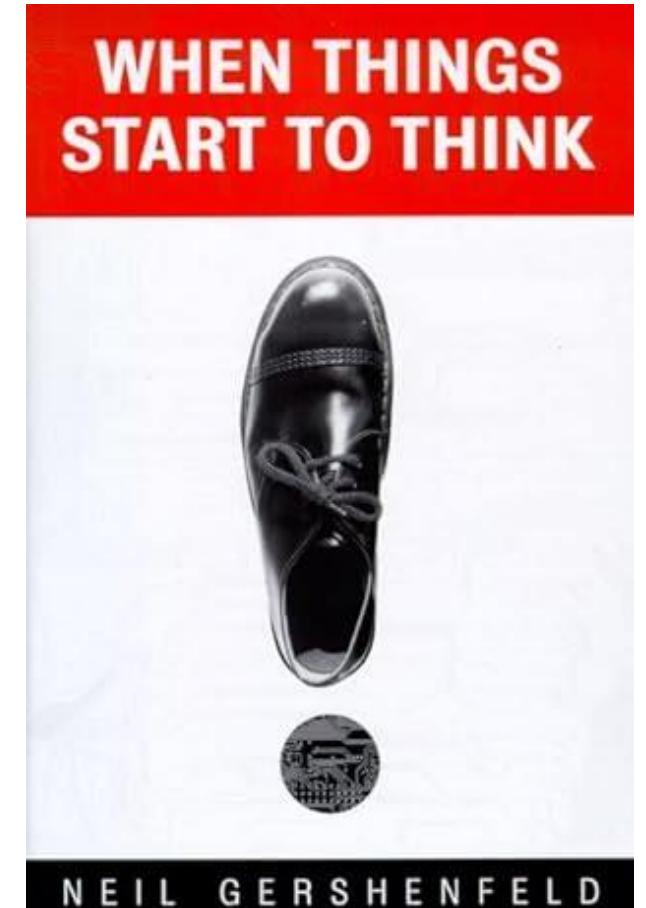

- The first connected object: Coca-Cola cans!
- A vending machine in the Carnegie Mellon University School of Computer Science.
- To go or not to go: because the machine was four minutes from his office and would occasionally be out of stock...
- “Great, now I can find out whether I have a coke.”

“When Things Start to Think”

- January 12, 1999
- MIT professor Neil Gershenfeld, Director of The Center for Bits and Atoms
- "the real electronic revolution will come when computers have all but disappeared into the walls around us."
- Explained the concept but not using the term.

“Father of IoT”

“I was talking about the supply chain being a ‘Network of Things,’ and the Internet being a ‘Network of Bits,’ and how sensor technology would merge the two together. Then I thought of an ‘Internet of Things,’ and I thought, ‘That’ll do – or maybe even better.’ It had a ring to it. It became the title of the presentation.” (1999)

- Kevin ASHTON

How Kevin Ashton named The Internet of Things, Avast, 2019

Kevin Ashton, Father of the Internet of Things & Network Trailblazer, Cisco, 2014

Definition of IoT

- No Universally Agreed IoT Definition

giant network of connected things and people – all of which collect and share data about the way they are used and about the environment around them

- IBM

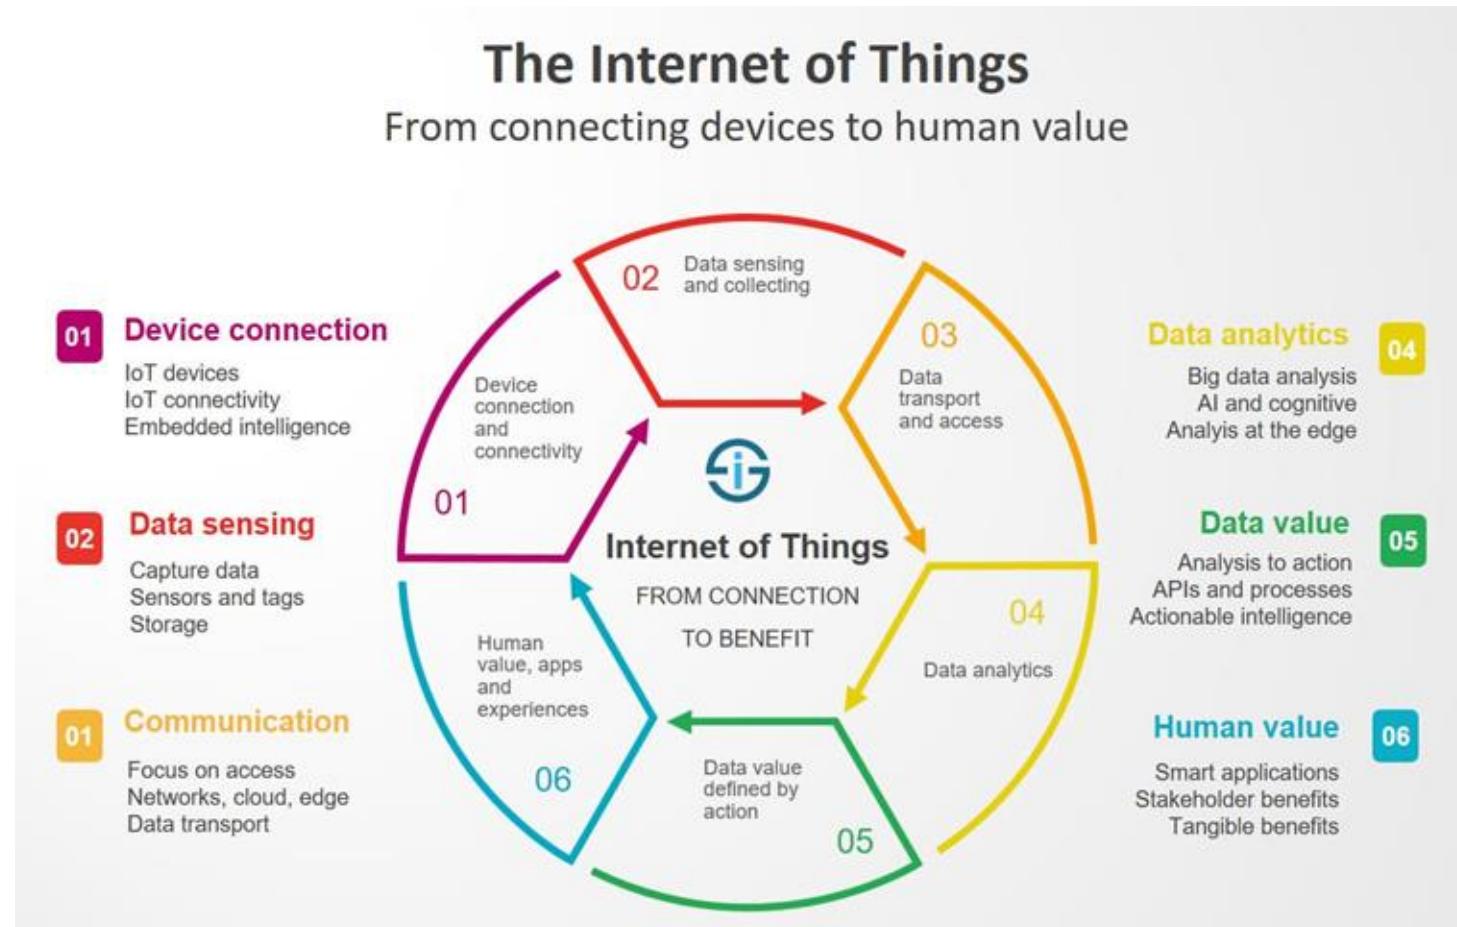

Definition of IoT

- No Universally Agreed IoT Definition

IoT is an umbrella term which describes a multi-faceted foundation for a range of applications and goals which are enabled through the connection of items (devices, sensors, tagged beings), equipped with data capture and communication capacities, uniquely identifiable and connected, in order to transmit and/or received data for a clear human, business or societal purpose.

FarmBeats: AI, Edge & IoT for Agriculture

How about Sensing?

- Sensing is mostly done by sensors, but not always.
- Dedicated sensors
 - Usually basic sensors, e.g., temperature, light, humidity sensors
 - Embedded in “sensor node” in WSNs
- Sensorless sensing
 - Re-use Radio-Frequency/sound/infrared/etc for sensing

Sensing is usually done by Sensors

Which of these are binary / multi-level sensors?

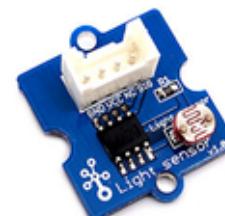

door contact

motion

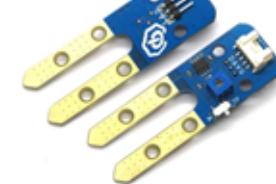

touch

light

3-axis
accelerometer

moisture

loudness

gas

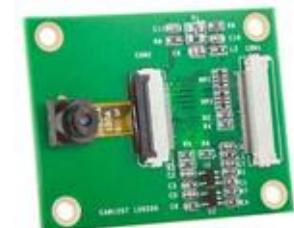

temperature

gyroscope

ultrasonic (range)

camera

Sensors on smartphones?

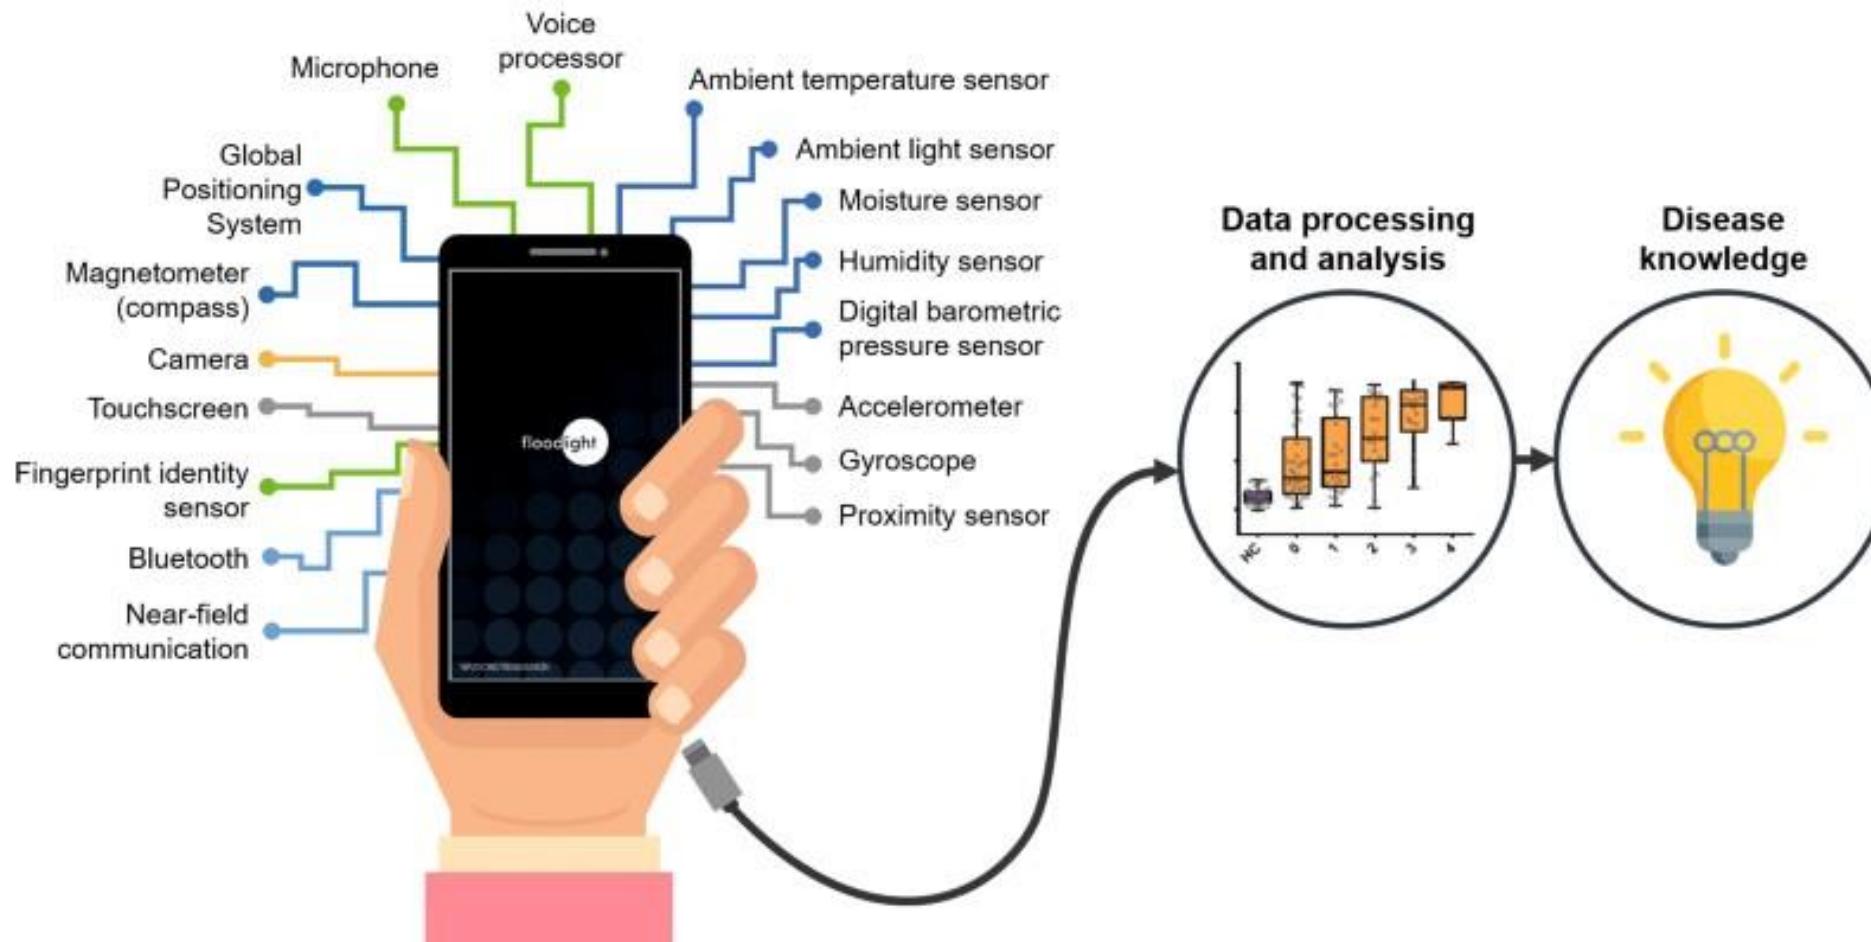

Role of “Things” in IoT

- mimic the role of ‘people’ connected over Internet

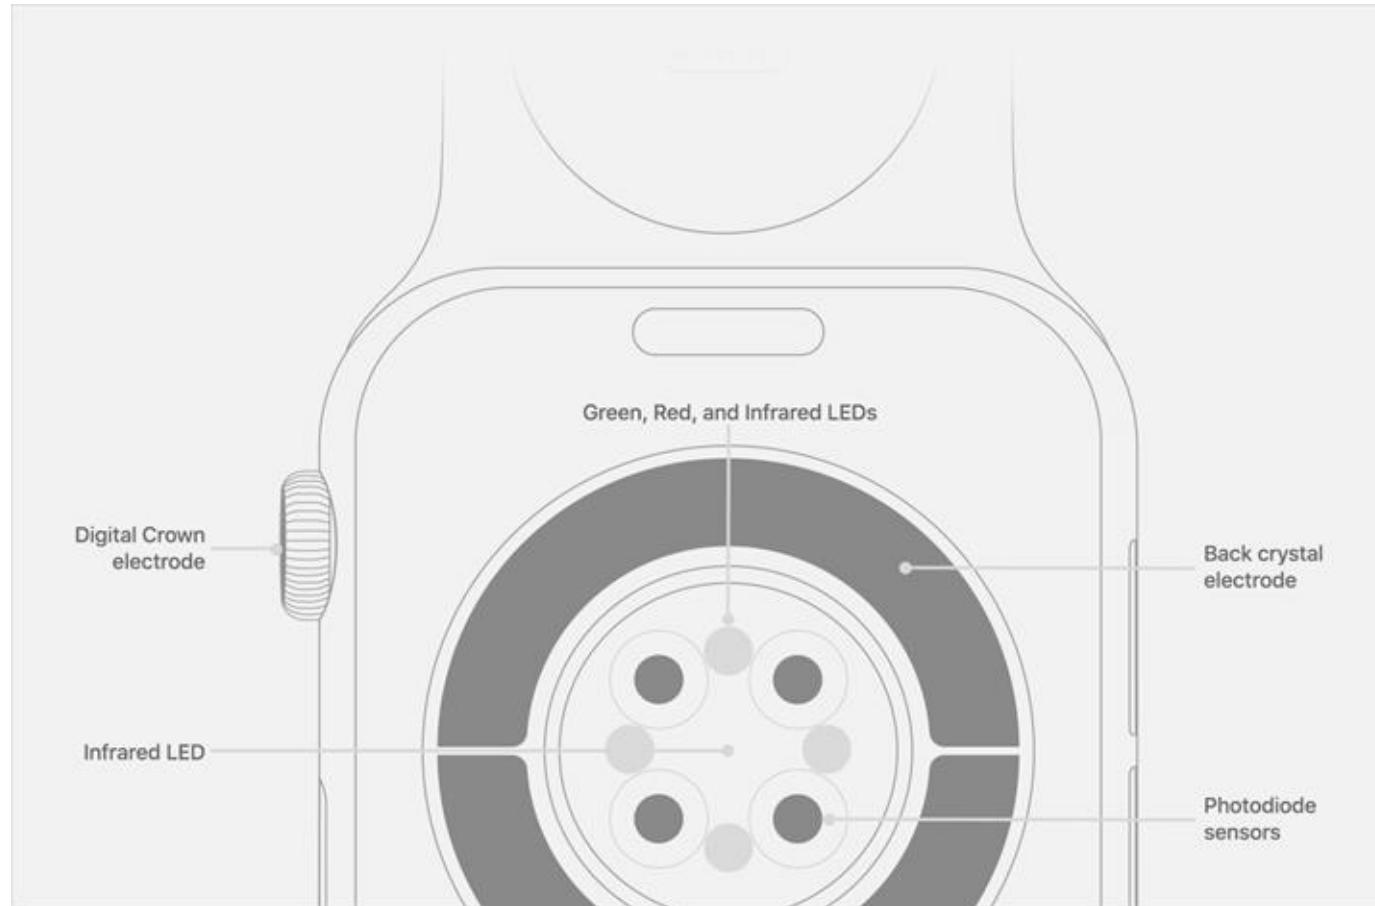

Ability to express context	sensors
Ability to respond	actuators
Intelligent	embedded processing/memory
Energized	battery/AC/energy-harvesting
Identifiable	unique addressing
Locatable	positioning
Reachable	wired/wireless connectivity

Things: Smartphones

Digital health: Smartphone-based monitoring of multiple sclerosis using Floodlight, Nature

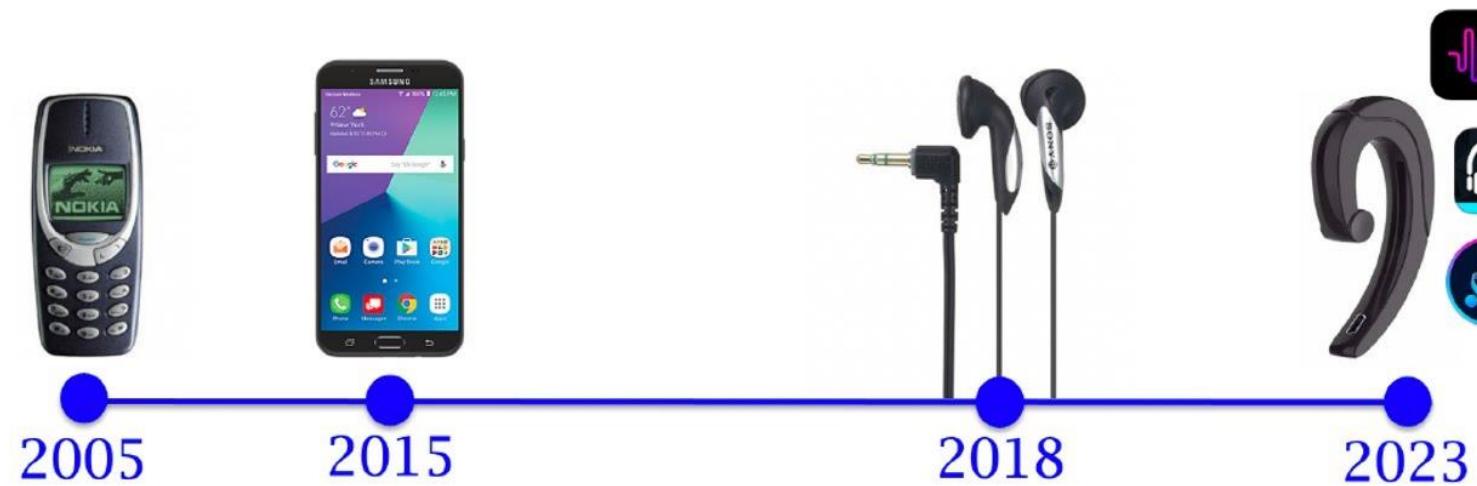

Things: Wearables

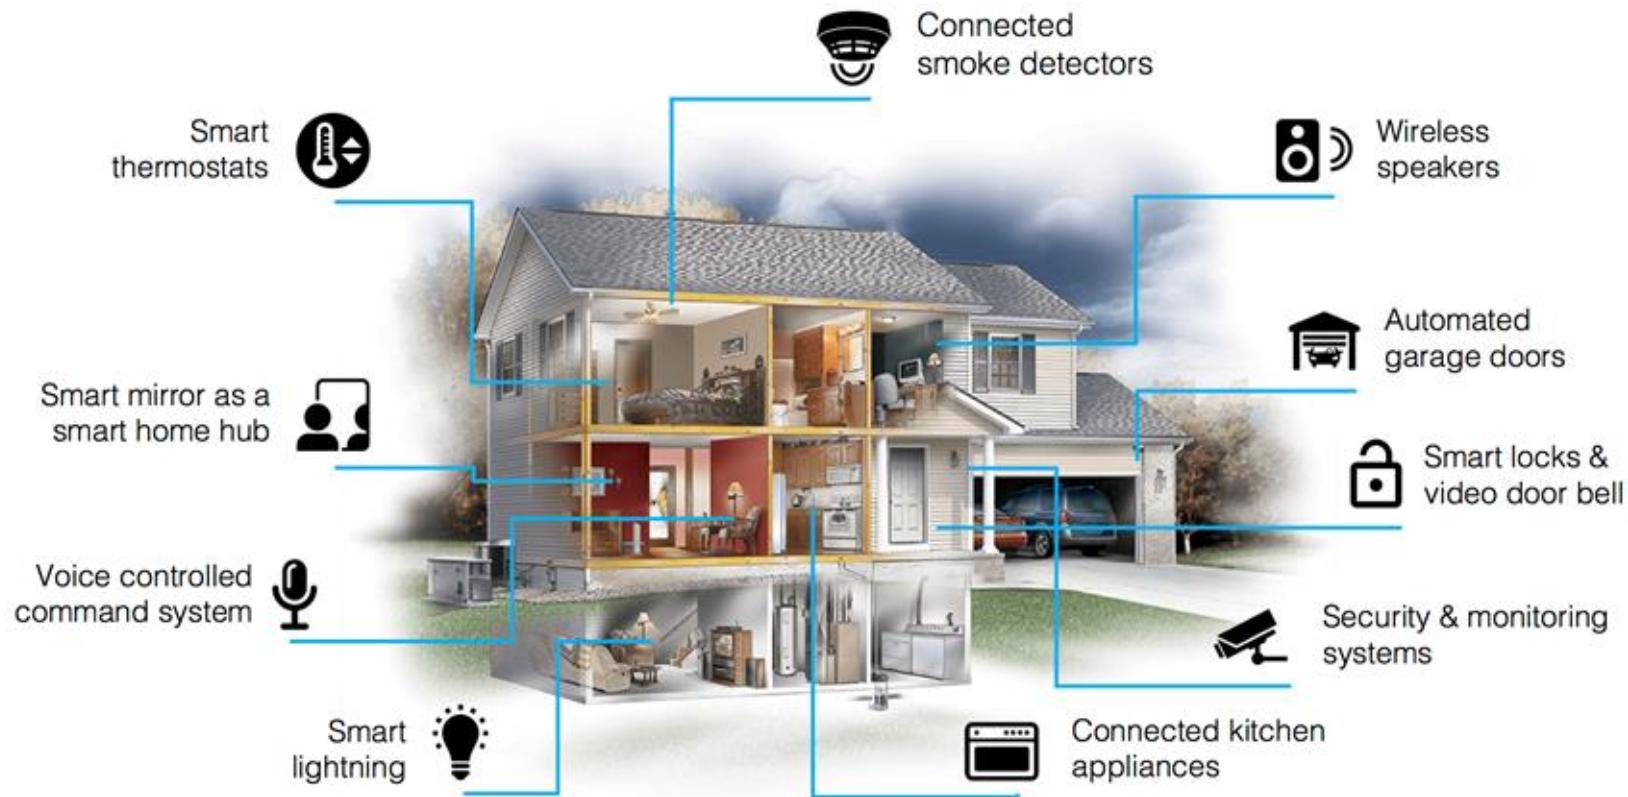

Monitor your heart rate with Apple Watch, apple.com

Things: Earables/Hearables

Earable computing

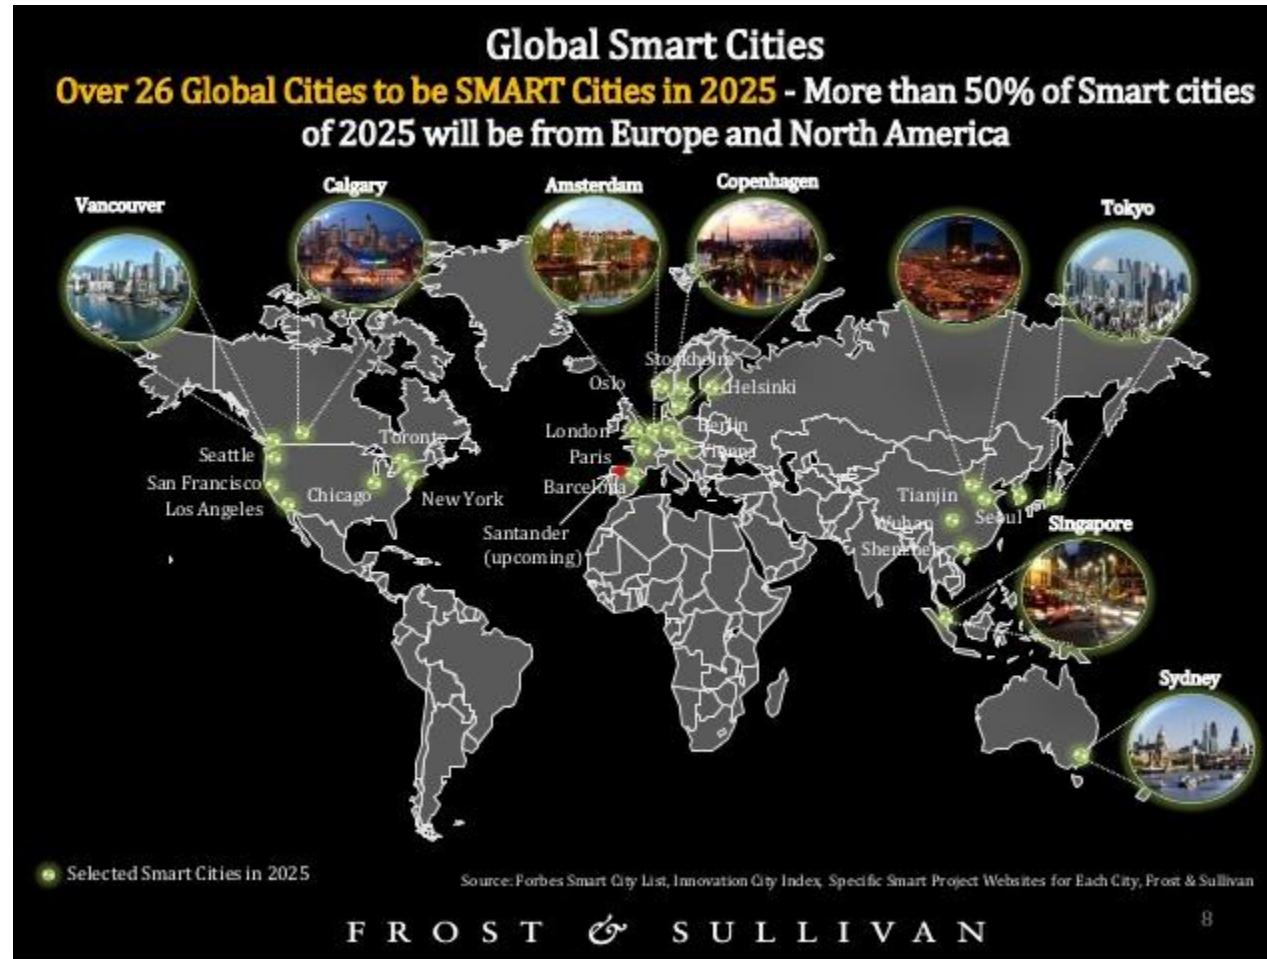

Things: Smart Home

[Smart home infographic, drror.com](http://smart-home-infographic.drror.com)

Things: Over 26 Smart Cities in 2025

Smart cities' spending on technology in the next six years is expected to reach \$327 billion by 2025 from \$96 billion in 2019.

Smart Cities to Create Business Opportunities Worth \$2.46 Trillion by 2025, Frost & Sullivan, 2020

What are we talking about when we talk about IoT?

- **Connectivity**

- How to connect billions/trillions of things?

- **Sensing**

- How to enable those connected things to sense the space?

How Does IoT Work?

IoT works by utilizing all its three main components:

1 SENSING: sensorized things to generate context (data)

2 CONNECTIVITY: interconnect data from things to the internet, and to sense-making infrastructure

3 SENSE-MAKING: converts data to actionable wisdom

IoT: Bridging Cyber and Physical Space

Connecting Billions of Things
Sensing the Environments

Today's AI Has Achieved Big Success

**Cannot see in the dark or through
the wall;
Neither with privacy.**

Why Wireless Sensing?

Any other concerns for Vision?

Tesla Vision Update: Replacing Ultrasonic Sensors with Tesla Vision

Safety is at the core of our design and engineering decisions. In 2021, we began our transition to Tesla Vision by removing radar from Model 3 and Model Y, followed by Model S and Model X in 2022. Today, in most regions around the globe, these vehicles now rely on Tesla Vision, our camera-based Autopilot system.

Now it appears **radar** is back. It's not yet clear which models will get the new **radar**. The type of **radar** Tesla intends to market next year is of a frequency that's allocated by the FCC for ADAS use cases, according to Ram Machness, chief business officer at Arbe Robotics, which produces ultra-high-resolution 4D imaging **radar**.

Tesla had originally filed with the FCC to use the new **radar** — which is described in filings as “76-77 GHz Automotive **Radar**” — in its vehicles back in June.

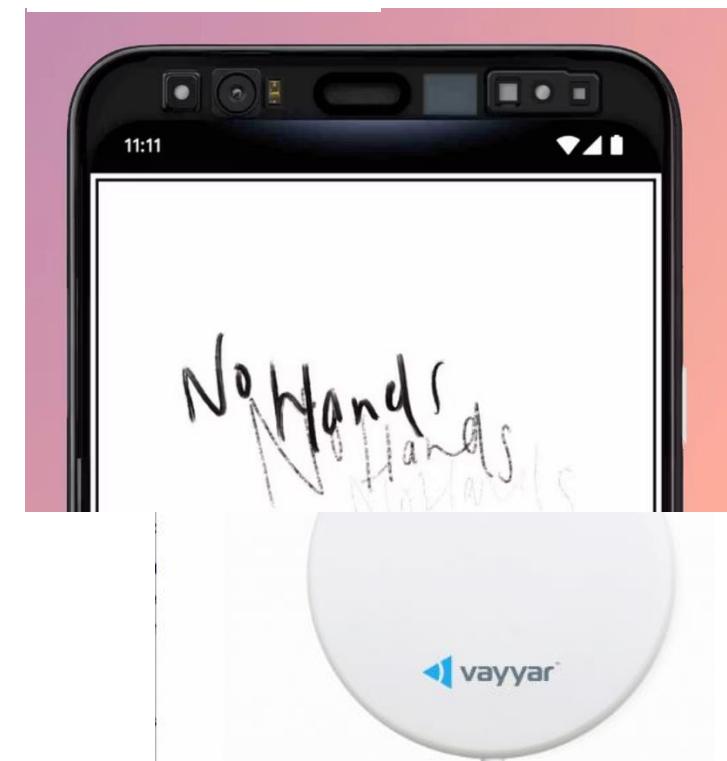

“From the frequency of operation (76-77GHz) as well as the mechanical design of the sensor from Tesla’s FCC filing, it

Ubiquitous Computing

The most profound technologies are those that disappear. They weave themselves into the fabric of everyday life until they are indistinguishable from it.

-- Mark Weiser
(The Father of Ubiquitous Computing)

The Computer for the 21st Century

Specialized elements of hardware and software, connected by wires, radio waves and infrared, will be as ubiquitous as no one will notice their presence.

In 1991, Peter Weiser, a computer scientist at Xerox PARC, coined the term "ubiquitous computing" to describe the vision of a world where computers are as common as the air we breathe. In this article, he outlines his vision of how computers will become invisible, integrated into everyday objects like chairs, tables, and walls, providing us with a "computer for the 21st century".

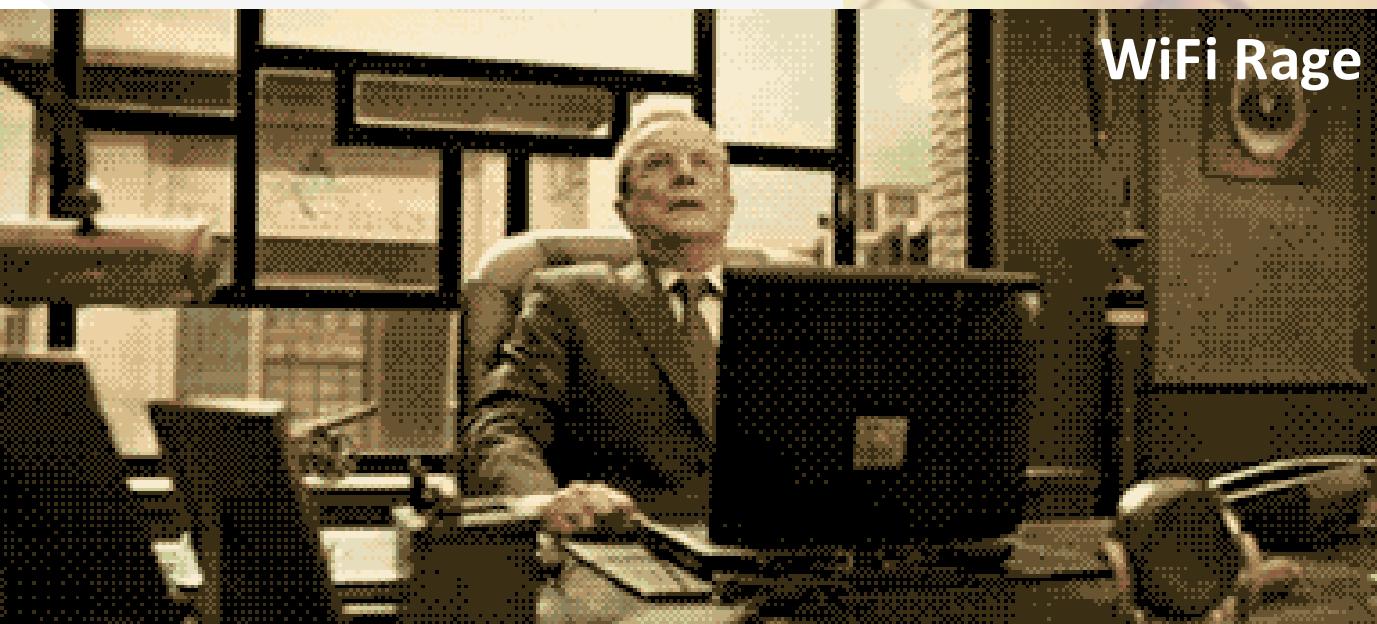

(Scientific American, 1991)

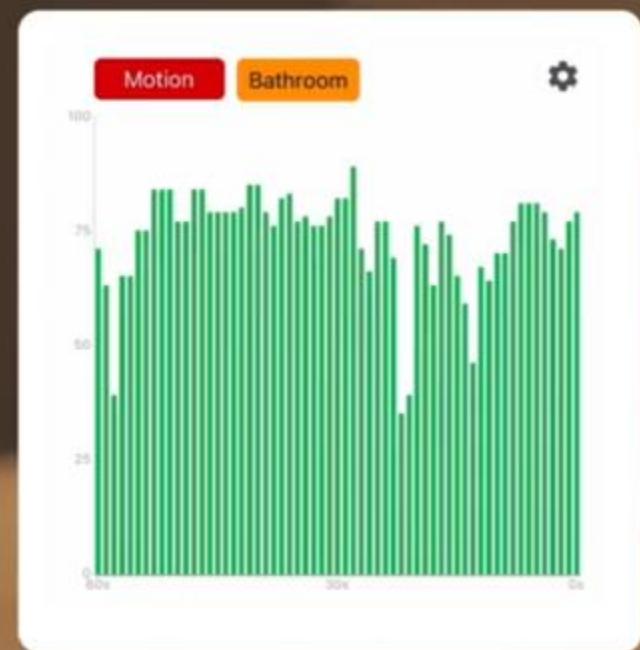

This course dives deeper into
the “most profound sensing
technologies that disappear”.

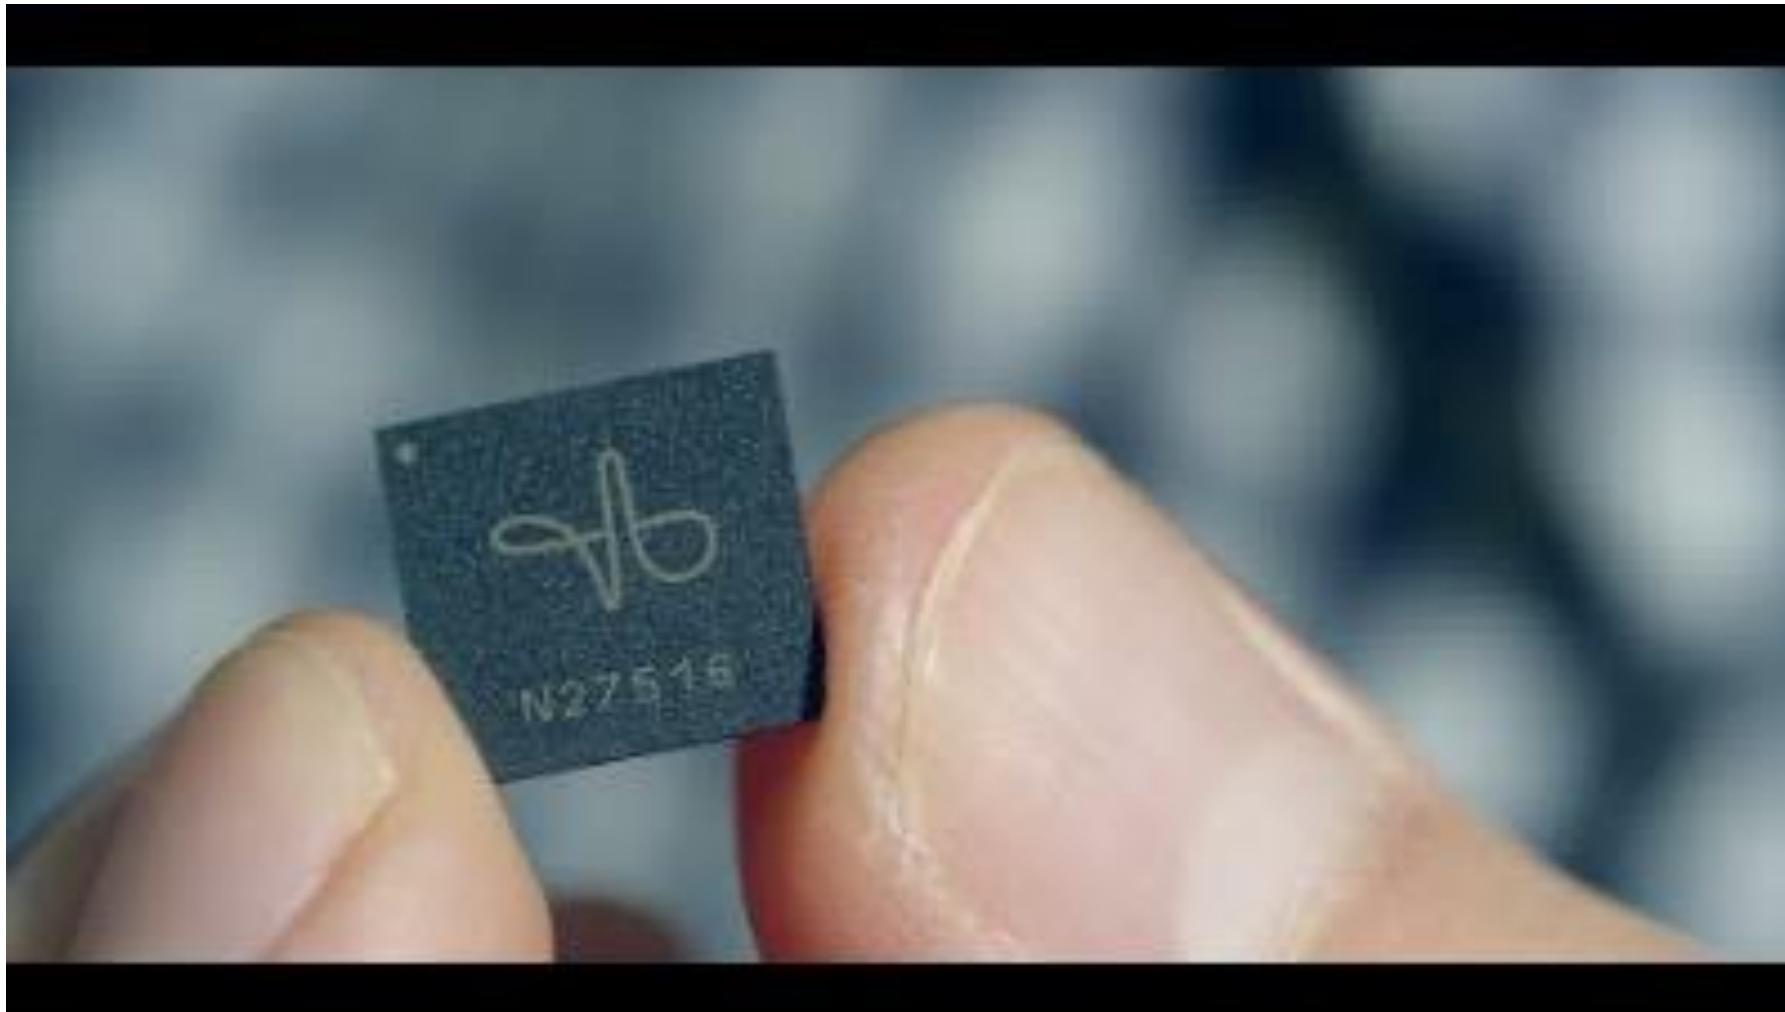

“Is WiFi bad to our health?”

**“Yes! Absolutely!
